I do not have control over participants of this project as neural recordings from humans epilepsy patients is such a scarce resource. However, epilepsy is a disease that affects all race and ethnicities, which means our study won't be discriminatory to any particular group. For data analysis, I am aware that some people may not have access to electronic devices growing up and they might not have equal access to resources in learning how to drive, which might cause discrepancies in their performance in our driving game. These discrepancies will be taken into consideration when analyzing the data and building computational models so these groups remain representative in the conclusions of this study.
